

Finding Lost Features in Cloned Systems

Jacob Krüger, Louis Nell, Wolfram Fenske, Gunter Saake, Thomas Leich

Agenda

Motivation

Mapping Process

Evaluation

Conclusion

Software Reuse in Practice

- Software reuse and customizing via cloning
- Potential problems?
 - Clones
 - Change propagation
 - Quality

Improving the Situation

- Extract features into reusable artefacts / improve clone management
- What happens if knowledge about the clones is missing?
- Automated analysis:
 - Feature location
 - Code clone detection
 - ...
- Still requires manual work!

Mapping Process

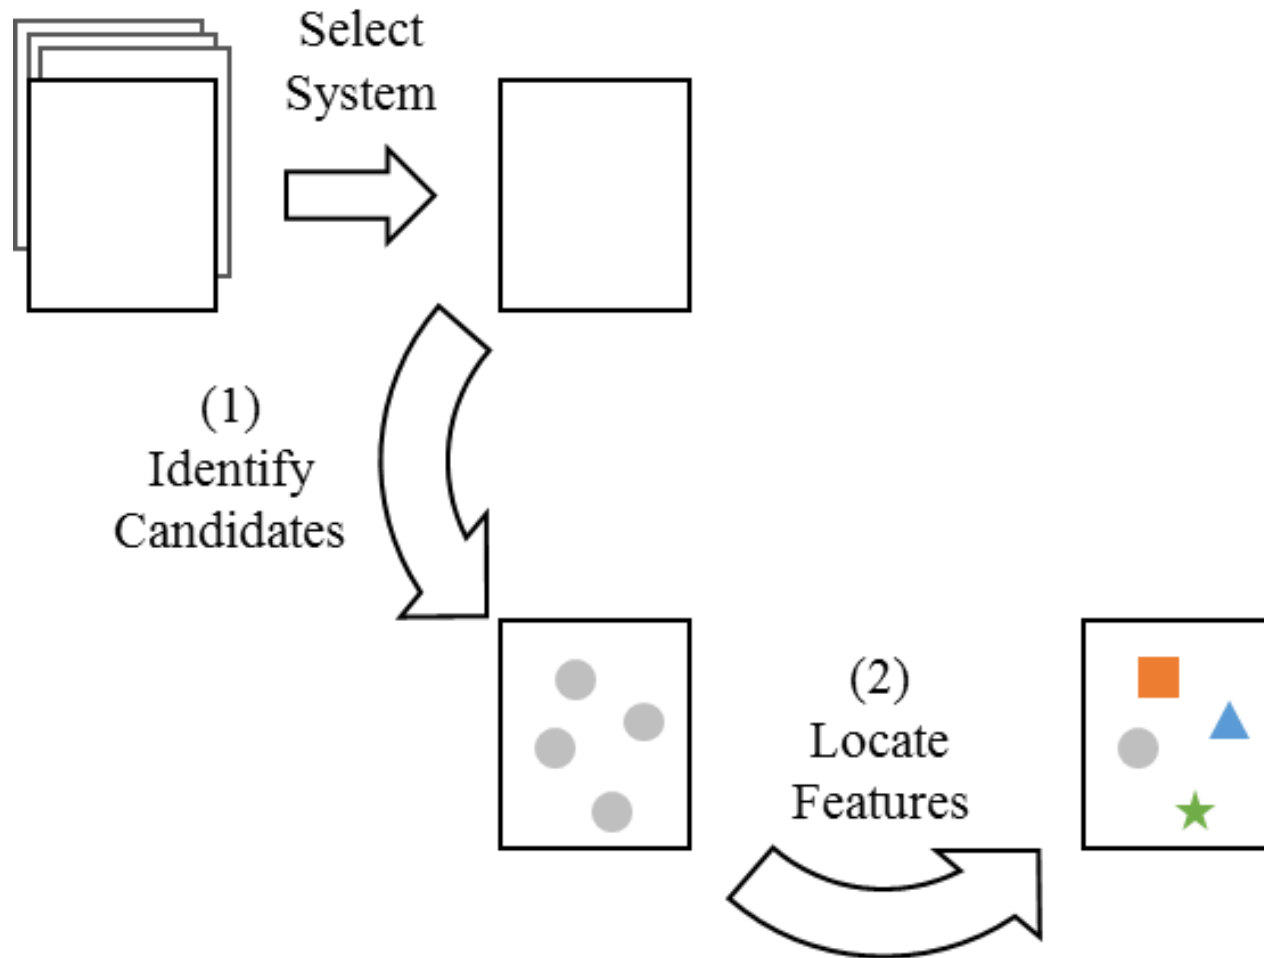

- Idea:
 - Language and tool independence
 - Step-wise to evaluate immediate results
 - Each considered clone analyzed once

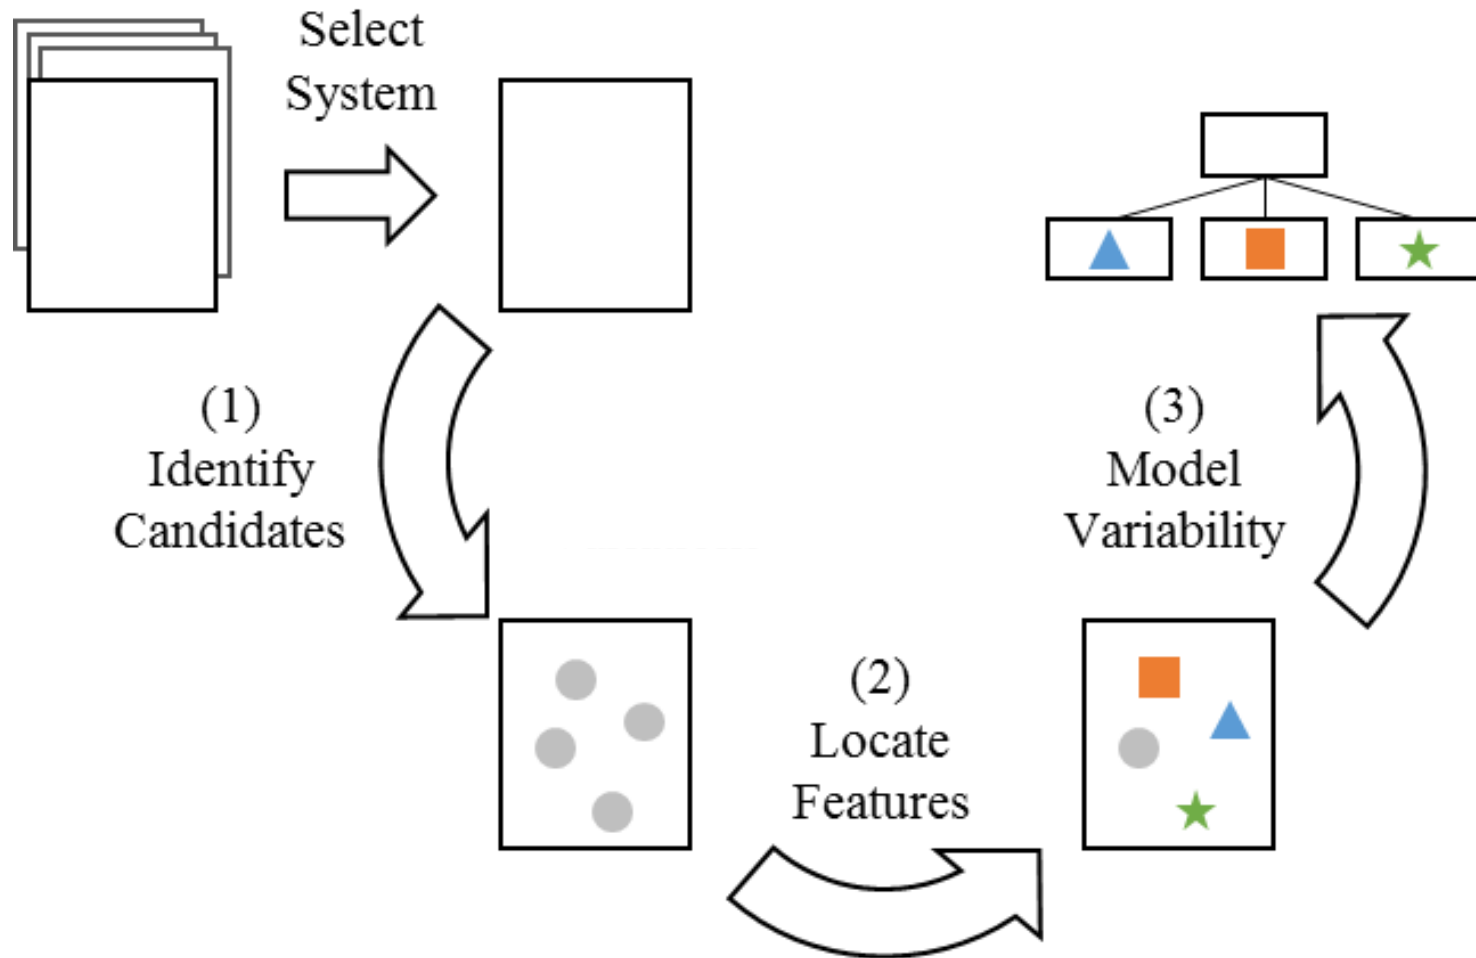

Mapping Process

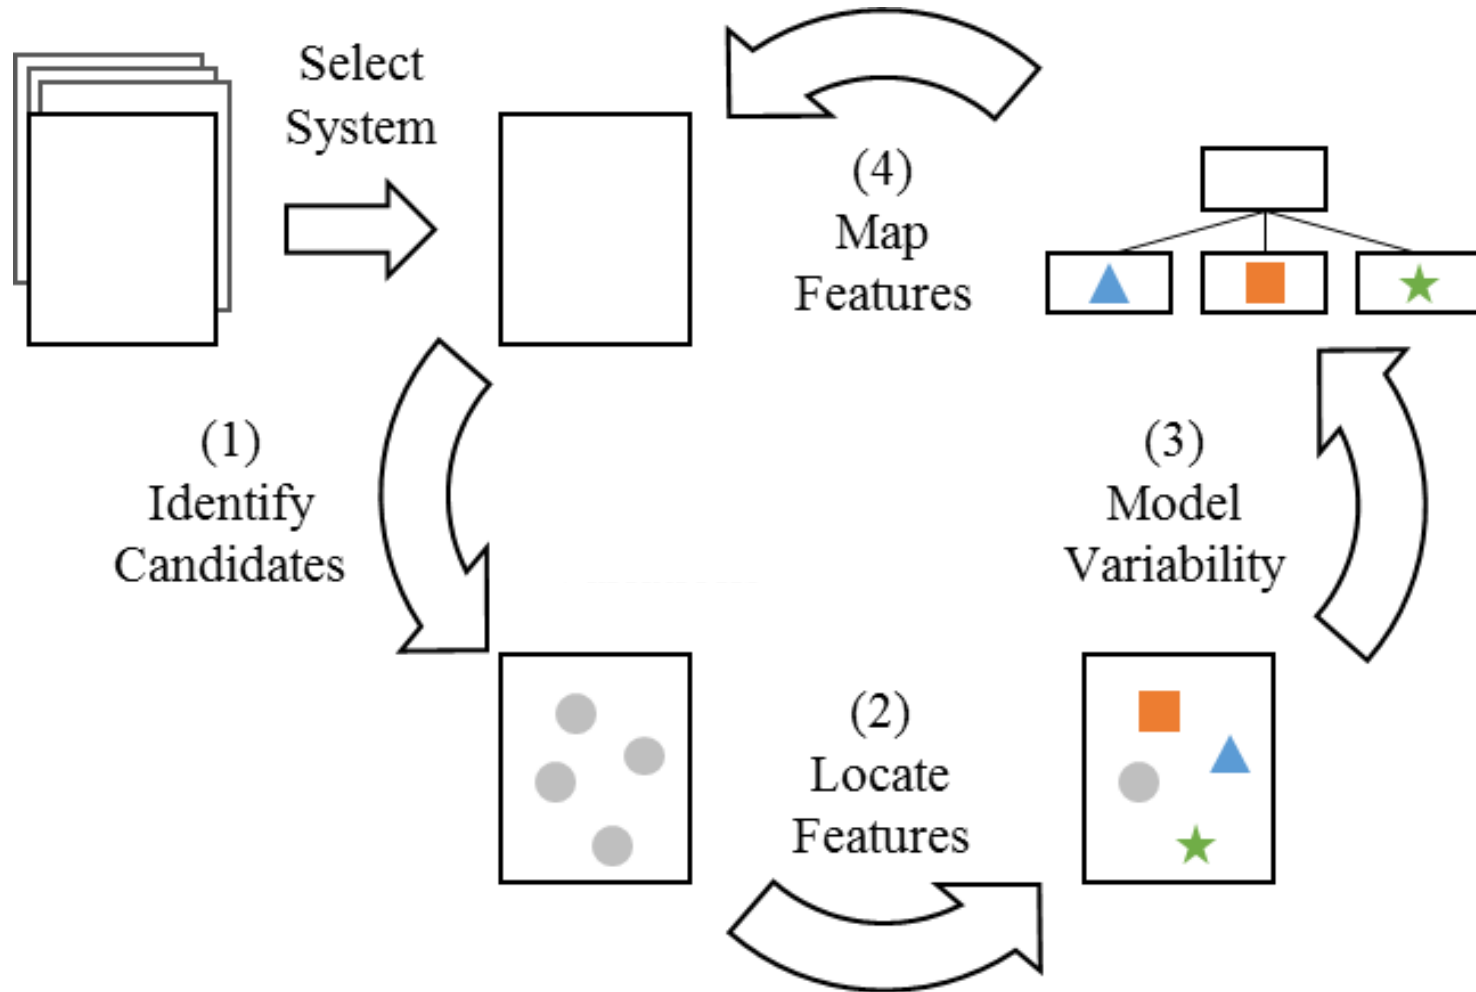

Mapping Process

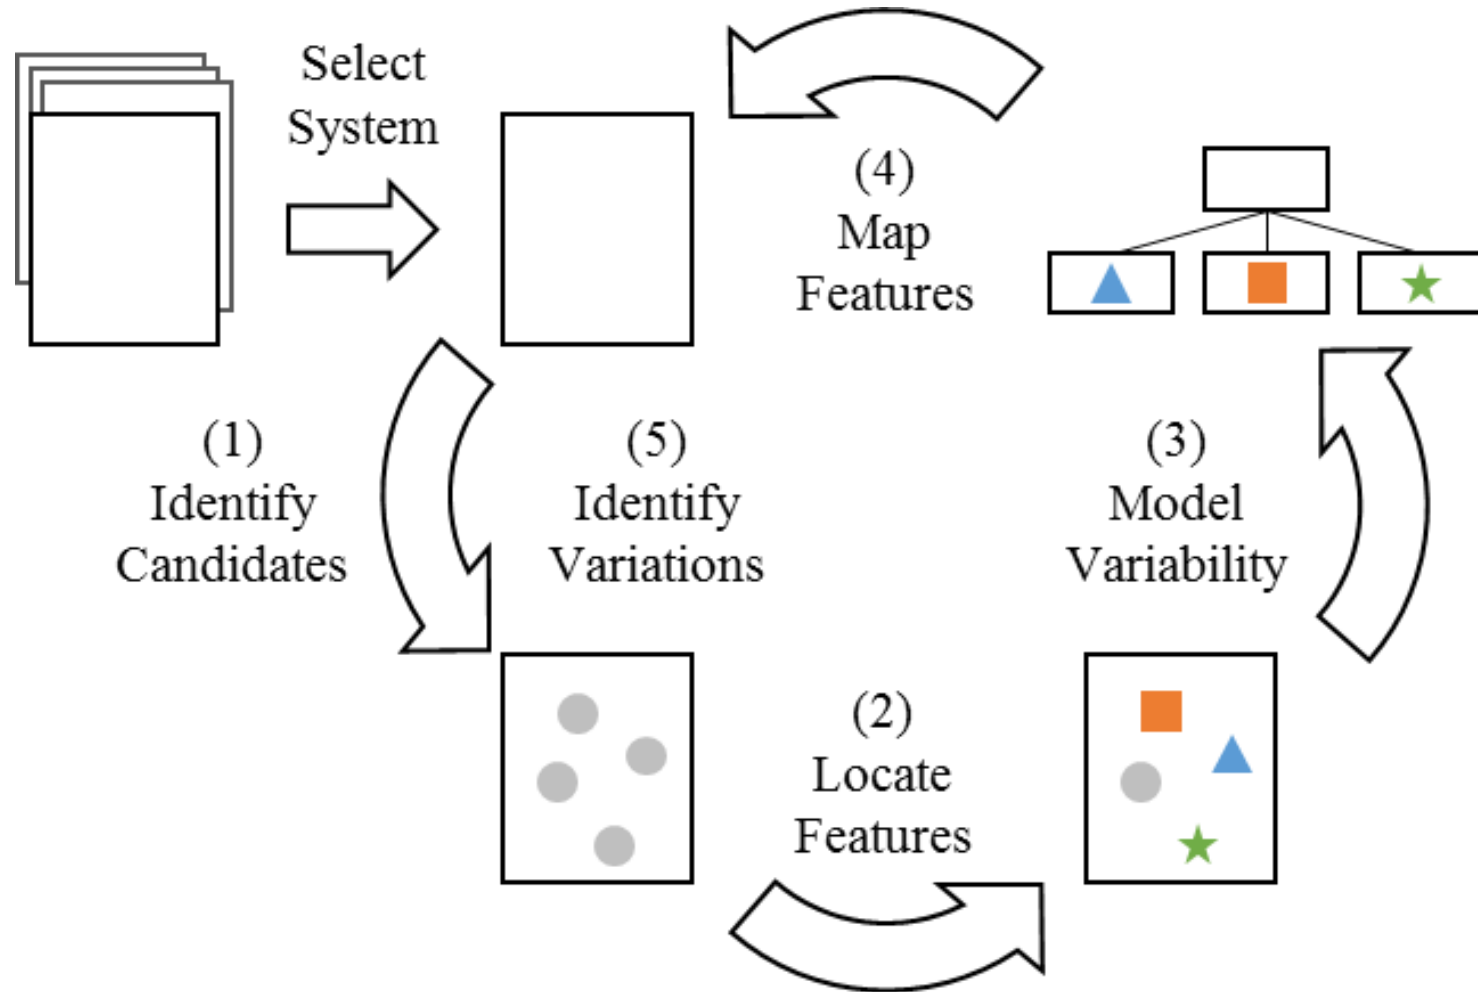

Mapping Process

Mapping Process

Mapping Process

Evaluation Setup

- Tools
 - Clone Detective
 - Visualization prototype
- Apo Games
 - Five cloned Java (Android) games
 - Reference study of one author
[Fenske et al. SANER 2017]
- Used one clone as analysis system

Reference Study

- Completely automatic refactoring
 - Rename instance method
 - Pull-up to common feature
- 15 common and 5 unique features

System	Base #SLOC	Migrated #SLOC	Δ SLOC
Dice	2,504	1,346	1,158
Clock	3,584	2,696	888
MonoDroid	6,483	5,490	993
Snake	2,946	1,786	1,160
MyTreasure	5,322	4,483	839
Common	-	1,779	-
Total	20,839	17,580	-15.6%

Research Questions

- RQ1 - How much of the extracted code in the reference study do we identify?
- RQ2 - How do the differences between our mapping and the reference study look like?
- RQ3 - How does a feature model for the subject systems look like?

Results

Feature	Function	#Classes	Σ SLOC				
			Dice	Clock	MonoDroid	Snake	MyTreasure
Base	Core functionality	2	275	275	275	199	275
Editor	Create levels	1	61	34	0	27	0
Game	Game objects	8	347	129	118	253	20
Load	Load levels	2	282	282	282	282	267
Menu	Menu	2	295	61	201	93	0
Puzzle Chooser	Select levels	2	121	111	0	121	0
Save	Save levels	1	17	17	17	17	17
Total			1,398	909	893	992	579

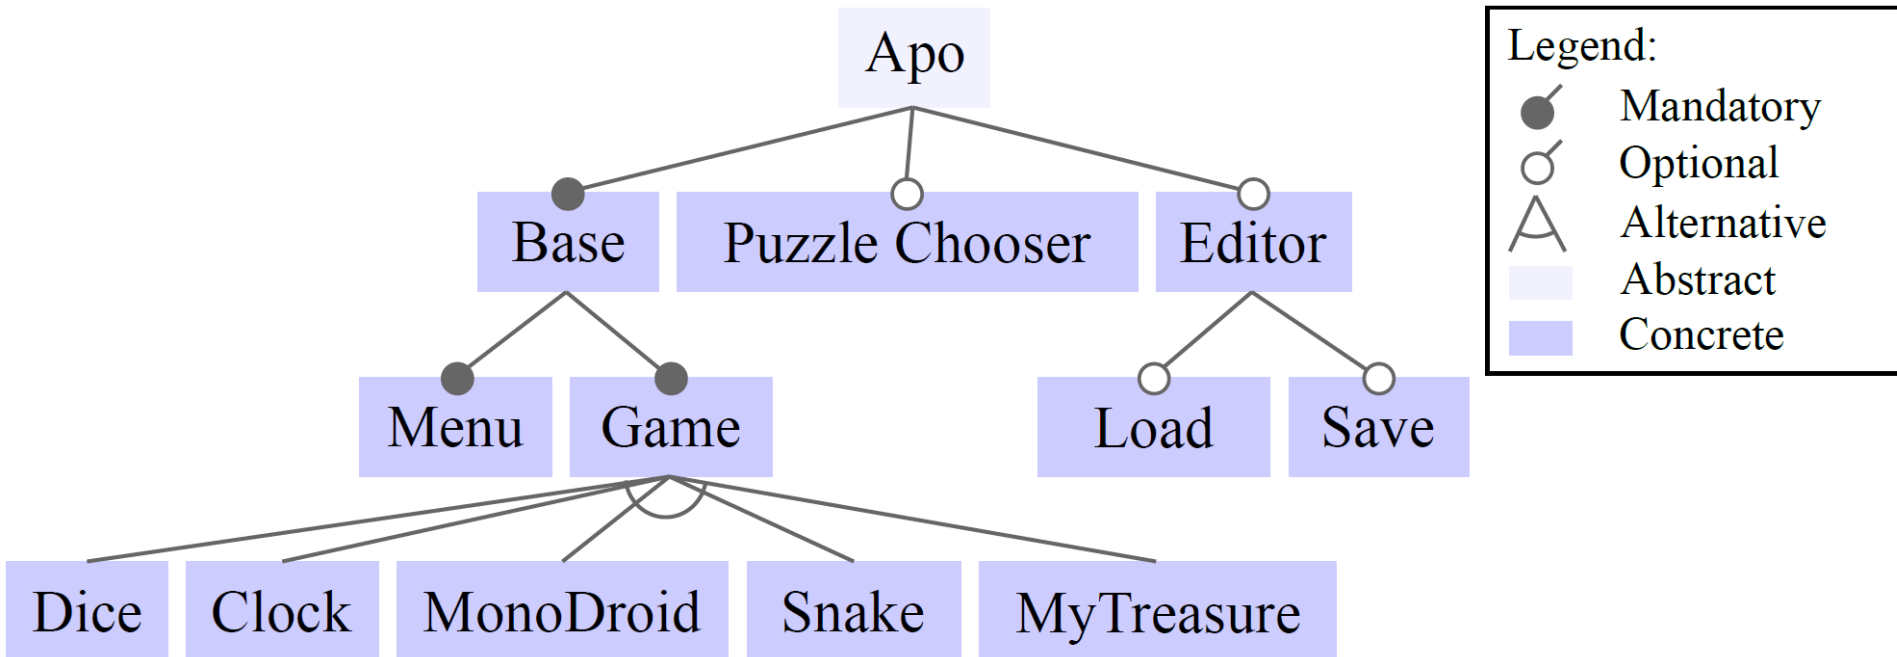

RQ1 – Extracted Code

- In Dice and Clock we found more common code
- In Snake and MyTreasure we found less common code
- Manual analysis identified more common code in initial clone
- But expensive to identify common code among all clones

RQ2 – The Differences

- Manual analysis found more but smaller common code parts
- Automatic refactoring extracted common but also non-feature code
- Incomplete and scattered features with automatic refactoring
 - Automatic: 619 SLOC feature among all clones
 - Manual: ???

RQ3 – The Feature Model

Conclusion

- Analyzing features in cloned systems is an essential task ...
- ... but full automation seems unfeasible
- We proposed a semi-automatic process to guide developers
- Implementation and further evaluations in the future
